

AuraBuy: Mobile App Analytics Dashboard

Mobile analytics pipeline built for AuraBuy, a React Native (Expo) e-commerce demo app. Integrated Firebase Analytics via the native SDK using Expo config plugins and a custom development build, since native modules require compiled code. Instrumented the full conversion funnel, sign_up, login, view_item, search, add_to_cart, begin_checkout, and purchase, with parameterized GA4 events (item_id, value, currency) validated in real time via DebugView. Configured BigQuery export from GA4, then wrote SQL against the raw events_* wildcard tables to aggregate event counts and funnel drop-off. Dashboard built in Looker Studio, connected directly to BigQuery. Stack: React Native, Expo (dev client), Firebase Analytics (native SDK), BigQuery, SQL, Looker Studio.
